1. INTRODUCTION

“The Virtual Metropolis” is an interactive installation combining traditional ink drawings and stop motion animation with video game technology. The artwork features various intermingled imaginary environments including cityscapes, factory districts and war zones. The user is invited to explore these worlds, seamlessly moving from one area to next, to discover satirically iconic animations and imagery. Conceptually the work emphasizes the immediate connections each environment has with the others while using humorous vignettes to express discontent towards a virtual world not too dissimilar from our own.

2. THE IMAGERY AND THE INTERFACE

The artwork features an array of symbolic imagery. The metropolis is overrun by denizens and billboards (figure 1), the factories are repetitiously entrancing (figure 2) and the war zone is enveloped by skeletons, bombs, and faceless people falling from the sky. The installation is designed to challenge predominant consumerist ideologies by exploring the relationships which exist between man, technology, progress and the natural environment. The interface emphasizes the role of the individual by offering a unique interactive experience in which the user can explore and affect the artwork; a semiotic acknowledgment of the importance and potential behind the actions of anyone who chooses to get involved (Antonelli, P. (2011).
